Motivations

Table of Contents

- 1 Description of the simulations
 - Hydrodynamical framework
 - $\text{Ly}\alpha$ radiation transfer
- 2 How the ISM structure impacts $\text{Ly}\alpha$ transfer
 - $\text{Ly}\alpha$ images
 - Spectral shapes
 - Escape fractions
- 3 Orientation effects
 - Spectral shapes
 - $\text{EW}(\text{Ly}\alpha)$ distributions
 - Angular escape fractions
- 4 $\text{Ly}\alpha$ diffuse emission

Hydrodynamical simulations of a dwarf isolated galaxy

Dubois & Teyssier 2008

Description of the simulations

- AMR code RAMSES *Teyssier 2002*
- dwarf : $M_{\text{gal}} = 10^{10} M_{\odot}$
- isolated : NFW density profile
- size of the box = 300 kpc
- gas fraction $f = \Omega_b / \Omega_m \sim 15\%$
- spin parameter $\lambda = 0.04$
- cooling, starformation, feedback
→ see *Dubois & Teyssier 2008,*

Verhamme et al 2011, in prep

MCLya : 3D Ly α radiation transfer code

General description of the code

- Monte Carlo technics, 3D, nested grid, Ly α + UV transfer
- MPI - parallelised
- physics included : HI, dust, Deuterium

Inputs

- distribution of sources
- H I distribution
- dust distribution
- velocity dispersion of the gas
- velocity field

Outputs

- integrated or resolved spectra
- Ly α images along any line of sight
- escape fraction
- non observables

nb of scatterings, time, altitude, emission location, etc...

Our two ISM models

the HOT galaxy G1

- EoS : $T_0 = 10^4\text{K}$ and $\rho_0 = 0.1\text{H.cm}^{-3}$
- minimum cell size : $\Delta x = 147\text{pc}$
- 10^5 photons
- calculation time : ~ 20000 hours

the COLD galaxy G2

- EoS : $T_0 = 10^2\text{K}$ and $\rho_0 = 10\text{H.cm}^{-3}$
- minimum cell size : $\Delta x = 18\text{pc}$
- 5×10^6 photons
- calculation time : ~ 200000 hours

Distribution of neutral gas

the HOT galaxy G1

the COLD galaxy G2

Distribution of sources

the HOT galaxy G1

the COLD galaxy G2

Distribution of sources

the COLD galaxy G2

Comparison of the ISM models : Ly α images

G1 face-on

image of G2 in the line

G2 face-on

image of G2 in the line

Comparison of the ISM models : spectral shapes

integrated spectra from G1

integrated spectra from G2

Comparison of the ISM models : escape fractions

f_{esc} vs density in G1

f_{esc} vs density in G2

Summary : Comparison of the ISM models

The HOT galaxy G1

- continuum escape fraction
 $f_{esc} = 0.95$

The COLD galaxy G2

- continuum escape fraction
 $f_{esc} = 0.22$

Summary : Comparison of the ISM models

The HOT galaxy G1

- continuum escape fraction
 $f_{esc} = 0.95$
- Ly α escape fraction
 $f_{esc} = 0.55$

The COLD galaxy G2

- continuum escape fraction
 $f_{esc} = 0.22$
- Ly α escape fraction
 $f_{esc} = 0.05$

Summary : Comparison of the ISM models

The HOT galaxy G1

- continuum escape fraction
 $f_{esc} = 0.95$
- Ly α escape fraction
 $f_{esc} = 0.55$
- symmetrical double-peaked spectra

The COLD galaxy G2

- continuum escape fraction
 $f_{esc} = 0.22$
- Ly α escape fraction
 $f_{esc} = 0.05$
- asymmetric peaks toward red -> outflow

Summary : Comparison of the ISM models

The HOT galaxy G1

- continuum escape fraction
 $f_{esc} = 0.95$
- Ly α escape fraction
 $f_{esc} = 0.55$
- symmetrical double-peaked spectra
- no diffuse halo

The COLD galaxy G2

- continuum escape fraction
 $f_{esc} = 0.22$
- Ly α escape fraction
 $f_{esc} = 0.05$
- asymmetric peaks toward red -> outflow
- diffuse halo a la *Steidel et al. 2011*

Summary : Comparison of the ISM models

The HOT galaxy G1

- continuum escape fraction
 $f_{esc} = 0.95$
- Ly α escape fraction
 $f_{esc} = 0.55$
- symmetrical double-peaked spectra
- no diffuse halo

The COLD galaxy G2

- continuum escape fraction
 $f_{esc} = 0.22$
- Ly α escape fraction
 $f_{esc} = 0.05$
- asymmetric peaks toward red -> outflow
- diffuse halo a la *Steidel et al. 2011*

Comparison of the ISM models

Strong discrepancies on Ly α AND UV properties

→ Ly α RT worth if small scales physics included

Orientation effects on spectral shapes

integrated spectra

density map edge-on

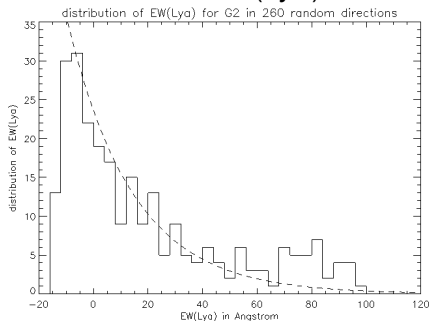

Orientation effects on EW(Ly α) distributions

Distribution of EW(Ly α) in G2

Orientation effects on EW(Ly α) distributions

Distribution of EW(Ly α) in G2

EW(Ly α) vs inclination in G2

Orientation effects on the escape fractions

Angular escape fractions

- continuum f_{esc} face-on 3 times higher than edge-on
→ variation of opacity with inclination
- Ly α f_{esc} (flux!) face-on 10 times higher than edge-on
→ detection biased towards face-on galaxies?

histogram of theta in G2

Summary : Orientation effects

Description

- f_{esc} (Ly α flux) 10 times higher face-on than edge-on
- strong correlation between EW(Ly α) and inclination
- correlation between spectral shape and inclination

Summary : Orientation effects

Description

- f_{esc} (Ly α flux) 10 times higher face-on than edge-on
- strong correlation between EW(Ly α) and inclination
- correlation between spectral shape and inclination

Implications

- detection biased towards face-on high-z galaxies
- over/under-estimate of $SFR(Ly\alpha) = 9.1 \times 10^{-43} L(Ly\alpha)$
- intrinsic scatter in the observed correlations (EW vs E(B-V), SFR, UV mag, mass...)

Ly α diffuse emission face-on

G2 face-on

G2 edge-on

Surface Brightness profiles

G1 face-on

Surface Brightness profile

Summary

Results

- Strong discrepancies in the Ly α properties of G1 and G2
→ Ly α RT worth in simulations where the physics of the cold gas is followed
- Orientation effects on Ly α properties of a virtual galaxy
→ detection bias toward face-on galaxies
→ correlation EW(Ly α) vs inclination, spectral shape vs inclination
- diffuse Ly α halo around G2 face-on, SB profile a la *Steidel et al. 2011*

Conclusions

Next steps

isolated galaxies

- coupling with ionising radiation transfer code *Rosdahl et al. 2011*
 - ionisation state of the ISM better modeled
- galaxies 10 times, 100 times more massive
 - decrease of Ly α escape with galaxy mass ?

Next steps

isolated galaxies

- coupling with ionising radiation transfer code *Rosdahl et al. 2011*
→ ionisation state of the ISM better modeled
- galaxies 10 times, 100 times more massive
→ decrease of Ly α escape with galaxy mass ?

galaxies in their cosmological context

- on going work on a galaxy at $z \sim 3$
→ Circum/Inter-galactic interactions ?
→ do orientation effects still play a role ?
- ongoing work on Ly α blobs simulations *Rosdahl et al. in prep*
